

Launch Rollback Plan

COG-PKG EMC Management System

Backup Posture

Daily Supabase Pro backups are accepted for launch.

Point-in-Time Recovery is intentionally not enabled due to cost.

Restore-to-new-project is available and preferred for recovery/investigation.

1. Bad Vercel Deployment

Use this when the app is broken after a deploy, but the database is probably fine.

1. Go to Vercel -> project -> Deployments.
2. Find the last known good production deployment.
3. Click the deployment -> promote/redeploy to Production.
4. Confirm /login, /emc, /contributions, and one API-backed page load.
5. Do not make database changes while debugging unless clearly needed.

Rule of thumb: If the issue appeared immediately after a code deploy, rollback Vercel first.

2. Bad Database / RLS / Policy Change

Use this when users suddenly get forbidden errors, missing data, or role behavior breaks after SQL changes.

1. Do not restore production immediately.
2. Check recent SQL changes and Supabase logs.
3. If it is a policy/function issue, apply a forward fix if obvious.
4. If data may be damaged, use Supabase -> Backups -> Restore to new project.
5. Inspect restored data in the new project.
6. Decide whether to manually repair production or migrate data back from the restored project.

Rule of thumb: Prefer forward-fixing RLS/policy mistakes. Use restore-to-new-project for data investigation.

Avoid overwriting production unless there is no better option.

3. Bad User / Role / Account Configuration

Use this when a user cannot access something they should, or can access something they should not.

1. Check emccaccounts: authuserid, isactive, memberid.
2. Check emccaccountroles.
3. Check role name spelling in emcroles.
4. For contribution users, check contribaccountregion.
5. If too much access was granted, remove the role/region first, then ask the user to sign out/in.

Emergency pattern: disable an account by setting emccaccounts.isactive = false.

4. Email / Invite Mistake

Use this if the wrong people receive invites or a bad FoT link batch goes out.

1. For Supabase Auth invites/resets: disable affected accounts or reset their access in emccounts.
2. For FoT registration links: deactivate or regenerate fotregtoken records.
3. Send corrected links only after invalidating the wrong ones.

5. Emergency Access Freeze

If you need to stop a specific user quickly, set that account inactive:

```
update public.emccounts set isactive = false where id = <account_id>;
```

For a broader freeze, avoid mass updates unless truly needed. Safer first moves are rollback Vercel, temporarily disable affected roles, or patch RLS/API route behavior.

Emergency Order

1. Roll back Vercel if code deploy caused it.
2. Forward-fix RLS/config if access broke.
3. Disable affected accounts if permissions are wrong.
4. Restore backup to new project for data investigation.
5. Only overwrite production as a last resort.
